ASSIGNMENT 03 – PFP191

Duration: 70'

==========

Software Requirements

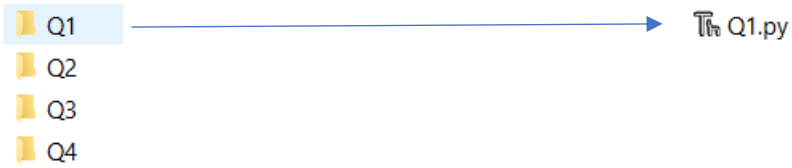

- Thonny, Notepad, Command Prompt, WinRAR / WinZip (or compress to ZIP file of Windows), Windows Explorer (File Explorer) on Windows 7 and above.

Students are ONLY Allowed to use:

- The materials like sample codes and program examples are stored on computer only.

Instructions

- Step 1: Students download the given materials from PEA Client.
- Step 2: Students read questions and prepare answers in the given template.
- Step 3: Submit a solution for each question:
    - The result is one folder for each question (Q1,Q2,Q3,Q4…), which contains **.py** source files.
      Example: Folder "Q1" contains Q1.py for question 1

    - For each question, you must submit one folder as above to PEA Client.

❖ **Importance:**

- Solutions will be marked by Automated Marking Software.
- **The use of tools other than those allowed in the above section whether intentionally or unintentionally, is considered a violation of the exam rules, and the mark is 0**
- Do not change the names of the folders, files, and, files and structure (format) of .py files specified in the exam. If you change it, the marking software can not find the execute file (.py) or the program output to mark, thus the score will be 0
- Do not edit given statements in the **main** function. If you change, the marking software can not mark and the score will be 0.

==========

Question 1: (2 marks)

The given file **Q1.py** already contains statements to input a string **s**. You should write statements to print the number of digits in strings **s**.

Notes:

- *Do not edit given statements in the **main** function*

- You can create new functions if you see it is necessary.

- The string was removed all extra space.

Sample input and output:

Input: Test Q1 (2 marks)

After processing: 2

Output for marking:

OUTPUT:

2

Question 2: (3 marks)

The given file **Q2.py** already contains statements to input a string **s**. You should write statements to print the number of word in strings **s**.

Notes:

- *Do not edit given statements in the **main** function.*

- You can create new functions if you see it is necessary.

- The string was removed all extra space.

Sample input and output:

Input: I miss you

After processing: 3

Output for marking:

OUTPUT:

3

Question 3: (2 marks)

The given file Q3.py already contains statements to input a string s. You should write statements to capitalize the strings. For example, capitalize from "FPT university" to "Fpt University"

Notes:

- *Do not edit given statements in the **main** function.*

- You can create new functions if you see it is necessary.

- The string was removed all extra space.

Sample input and output:

Input: FPT university

After processing: Fpt University

Output for marking:

OUTPUT:

Fpt University

Question 4: (3 marks)

The given file Q4.py already contains statements to input a string s. You should write statements to compress a string using the counts of repeated characters. For example, the string "aabccccccaaa" would become "a2b1c5a3".

Notes:

- *Do not edit given statements in the **main** function.*

- You can create new functions if you see it is necessary.

- The string was removed all extra spaces

Sample input and output:

Input: aabccccccaaa

After processing: a2b1c5a3

Output for marking:

OUTPUT:

a2b1c5a3
